uestion # 7 of 10 (Start time: 09:34:15 PM, 25 August 2020)

Threat to internal validity of an experiment arises because of a change in the m

Select the correct option

- Testing Effect
- Maturation Effect
- Statistical Regression
- Instrumentation Effect

their responses on the posttest, which will adversely impact on internal validity. It is also called sensitization through previous testing.

4. Instrumentation Effects: Instrumentation effects are yet another source of threat to internal validity. These might arise because of a change in the measuring instrument between pretest and posttest, and not because of the instrument's differential impact at the end. For example, in a weight-loss experiment, the springs on the scale weaken during the experiment, giving lower readings in the posttest.

A change in the wording of questions (may be done to avoid testing effects)

VU
VUHID 0306-7099313 (STA630) Quiz # 2 (2021,2020,2019,2018)

data. They also provide programs for entering and [illegible] sizeable arrays of programs for descriptive analysis and univariate, bivariate, and [illegible] statistical analysis.

Results with one variable

Frequency Distribution ← ایک متغیر کے ساتھ نتائج

Several useful techniques for displaying data are in use. The easiest way to describe the numerical data of one variable is with a frequency distribution. It can be used with nominal, ordinal, interval, or ratio-level data and takes many forms. For example we have data of 400 students. We can summarize the data on the gender of the students at a glance with raw count or a *frequency distribution*

cannot make assignments on the basis of personal preference or the features of specifi
cases.

Random assignment is random in statistical/mathematical sense, not in everyday sense. In everyday
speech, random means unplanned, haphazard, or accidental, but it has a special meaning in
mathematics. In probability theory, random describes a process in which each case has a known
chance of being selected. Random selection allows the researcher to calculate the odds that a specific
case will be sorted into one group or the other. A random process is the one in which all cases have an
exactly equal chance of ending up in one or the other group.

Random assignment or randomization is unbiased because a researcher's desire to confirm a
hypothesis or a research subject's personal interests does not enter into the selection process. It also
assures the researcher that repetitions of an experiment – under the controlled conditions – will show
true effects, if they exist. Random assignment of subjects allows the researcher to assume that the
groups are identical with respect to all variables except for experimental treatment.

Random assignment of subjects to the various experimental groups is the most common technique
used to prevent test units from differing from each other on key variables; it assumes that all the
have been similarly randomized. If the experimenter believes that

Research Methods-STA630

A scale is a measure in which the researcher captures the intensity, direction, level, or potency of a variable construct. It arranges responses or observation on a continuum. A scale can use single indicator or multiple indicators. Most are at the ordinal level of measurement.

ion # 8 of 10 (Start time: 09:35:47 PM, 25 August 2020)

_____ is a measure in which the researcher captures the level

t the correct option

- Scale
- Index
- Collapsing
- Combining

SHAHID 0306-7099313 (STA630) Quiz # 2 (2021,2020,2019,2018)

Parameter

A parameter is the summary description of a given variable in a population. The mean income of all families in a city and the age distribution of the city's population are parameters. An important part of survey research involves the estimation of population parameters on the basis of sample observation.

Statistic

A statistic is the summary description of a given variable in a survey sample. Thus the mean income computed from the survey sample and the age distribution of that sample are statistics. Sample statistics are used to make estimates of the population parameters.

Sampling Error

Probability sampling methods seldom, if ever, provide statistics exactly equal to the parameters they are used to estimate. Probability theory, however, permits us to estimate the error to be expected for a given sample (more information to be sought from professional in Statistics).

STA630:Quiz 2

Question # 10 of 10 (Start time: 10:29:02 AM, 25 August 2020)

The group that receives the experimental treatment condition is called as

Select the correct option

- Experimental group
- Control group
- Participant group
- Independent group

STAHD.PK-706-709913 (STA630) Quiz # 2 (2021,2020,2019,2018)

use three measures of central tendency, or measures of the center of the frequency distribution: mean, median and mode, which are often called averages (a less precise and less clear way to say the same thing). The *mode* is simply the most common or frequently occurring number. The *median* is the middle point. The *mean* also called the arithmetic average, is the most widely used measure of central tendency. A particular central tendency is used depending upon the nature of the data.

Bivariate Tables → 2 Variables

The bivariate contingency table is widely used. The table is based on cross-tabulation (cross-classification); that is the cases are organized in the table on the basis of two variables at the same time.

SHAHID 0306-7088313 (STA630) Quiz # 2 (2021,2020,2019,2018)

The replication pattern is the easiest to understand. It is when the partials replicate or reproduce the same relationship that existed in the bivariate table before considering the control variable. It means that the control variable has no effect.

Explain specification pattern with the help of example?

The specification pattern is the next easiest pattern. It occurs when one partial replicate the initial bivariate relationship but other partials do not. For example, we find a strong (negative) bivariate relationship between age of the respondents and attitude towards women empowerment. We control for gender and discover the relationship holds only for males (i.e. the strong negative relationship was in the partial for males, but not for females). This is specification because a researcher can specify the category of the control variable in which the initial relationship persists.

Question # 6 of 10 (Start time: 04:27:32 PM, 25 August 2020) Total Marks: 1

Which of the following describes the situation in which the control variable intervenes between the original independent variable and the dependent variables?

Select the correct option

- Replication pattern
- Suppressor variable pattern
- Negative linear relationship
- Interpretation pattern
